Neural Network Workflow Systems

Big Data Analytics, The Class

Goal: Generalizations A *model* or *summarization* of the data.

Data Workflow Frameworks

Hadoop File System

Spark

Streaming

MapReduce

Deep Learning Frameworks

Analytics and Algorithms

Similarity Search
Hypothesis Testing
Transformers/Self-Supervision
Recommendation Systems
Link Analysis

Spark is fast for being so flexible

- Fast: RDDs in memory + Lazy evaluation: optimized chain of operations.
- Flexible: Many transformations -- can contain any custom code.

Spark is fast for being so flexible

- Fast: RDDs in memory + Lazy evaluation: optimized chain of operations.
- Flexible: Many transformations -- can contain any custom code.

However:

 Hadoop MapReduce can still be better for extreme IO, data that will not fit in memory across cluster.

Spark is fast for being so flexible

Learning Objectives

- Understand a neural network as transformations on tensors.
- Understand PyTorch as a data workflow system.
 - Know the key components of PyTorch
 - Understand the key concepts around distributed neural network processing in PyTorch.
- Establish a foundation to distribute deep learning models

Linear Regression: $\hat{y} = \beta X$

Objective: Learn w, such that $(y - \beta X)^2$ is minimized

Linear Regression: $\hat{y} = \beta X$

Objective: Learn w, such that $(y - \beta X)^2$ is minimized

How do we solve for β ?

Linear Regression: $\hat{y} = \beta X$

Objective: Learn w, such that $(y - \beta X)^2$ is minimized

How do we solve for β ?

 Analytic Gradient: Differentiate the objective, solve the system of equations by equating it to 0

Linear Regression: $\hat{y} = \beta X$

Objective: Learn w, such that $(y - \beta X)^2$ is minimized

How do we solve for β ?

1. Analytic Gradient: Differentiate the objective, solve the system of equations by equating it to 0

$$\beta_{opt} = (X^T X)^{-1} X^T y$$

Linear Regression: $\hat{y} = \beta X$

Objective: Learn w, such that $(y - \beta X)^2$ is minimized

How do we solve for β ?

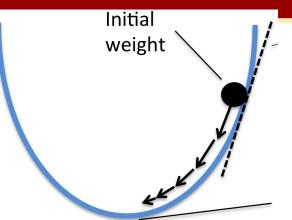

- 1. Analytic Gradient: Differentiate the objective, solve the system of equations by equating it to 0
- 2. Numerical Gradient: Start at a random point and move in the direction of minima until optima is reached

Linear Regression: $\hat{y} = \beta X$

Objective: Learn w, such that $(y - \beta X)^2$ is minimized

How do we solve for β ?

- Analytic Gradient: Differentiate the objective, solve the system of equations by equating it to 0
- 2. Numerical Gradient: Start at a random point and move in the direction of minima until optima is reached

$$\hat{\beta} = argmin_{\beta} \{ \sum_{i}^{N} (y_i - \hat{y}_i)^2 \}$$

$$\hat{eta} = argmin_{eta} \{ \sum_{i}^{N} (y_i - \hat{y_i})^2 \}$$
 matrix multiply $\hat{y}_i = X_i eta$

$$\hat{\beta} = argmin_{\beta}\{\sum_{i}^{N}(y_{i}-\hat{y_{i}})^{2}\}$$
 matrix multiply
$$\hat{y}_{i} = X_{i} \hat{\beta} \quad \text{Thus:} \quad \hat{\beta} = argmin_{\beta}\{\sum_{i=0}^{N}(y_{i}-X_{i}\beta)^{2}\}$$

Linear Regression: Trying to find "betas" that minimize:

$$\hat{\beta} = argmin_{\beta} \{ \sum_{i}^{N} (y_i - \hat{y}_i)^2 \}$$

$$\hat{y}_i = X_i eta$$
 Thus: $\hat{eta} = argmin_{eta} \{ \sum_{i=0}^N (y_i - X_i eta)^2 \}$

How to update? $\beta_{new} = \beta_{prev} - \alpha * \text{grad}$

Linear Regression: Trying to find "betas" that minimize:

$$\hat{\beta} = argmin_{\beta} \{ \sum_{i}^{N} (y_i - \hat{y}_i)^2 \}$$

$$\hat{y}_i = X_i eta \qquad ext{Thus:} \qquad \hat{eta} = argmin_eta \{ \sum_{i=0}^N (y_i - X_i eta)^2 \}$$

How to update? $\beta_{new} = \beta_{prev} - \alpha * \text{grad}$

a: Learning Rate

$$\hat{\beta} = argmin_{\beta}\{\sum_{i}^{N}(y_{i}-\hat{y_{i}})^{2}\}$$
 Initial weight
$$\hat{y}_{i} = X_{i}\beta \qquad \text{Thus:} \qquad \hat{\beta} = argmin_{\beta}\{\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{i=0}^{N}(y_{i}-\sum_{$$

Linear Regression: Trying to find "betas" that minimize:

Gradient Descent: $\beta_{new} = \beta_{prev} - \alpha * \text{grad}$

Linear Regression: Trying to find "betas" that minimize:

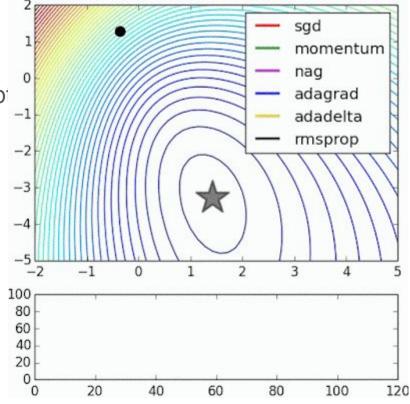

Gradient Descent: $\beta_{new} = \beta_{prev} - \alpha * \text{grad}$

But there are other gradient descent based optimization methods which are better*

Linear Regression: Trying to find "betas" that minimize:

Gradient Descent: $\beta_{new} = \beta_{prev} - \alpha * \text{grad}$

But there are other gradient descent based op

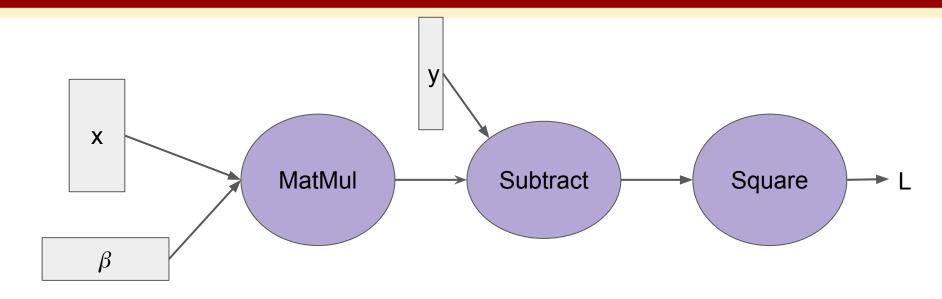

Animation: Alec Radford

How do Machine learning/ Deep learning frameworks represent these models?

How do Machine learning/ Deep learning frameworks represent these models?

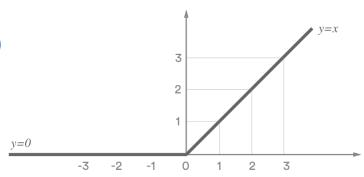

Computational Graph!

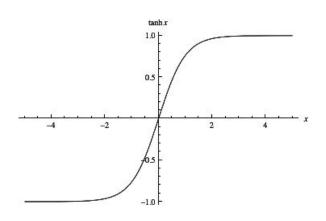

$$L = (y - \beta x)^2$$

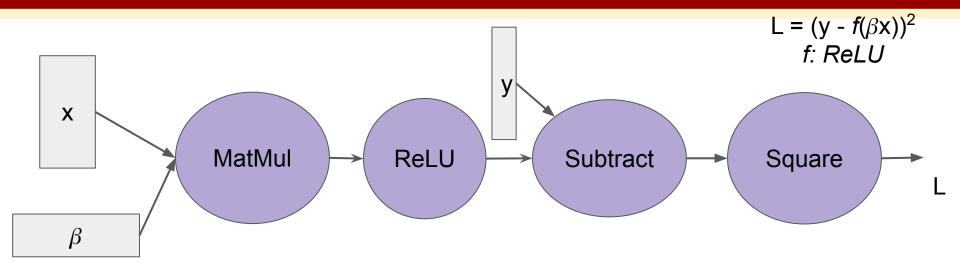

Activations

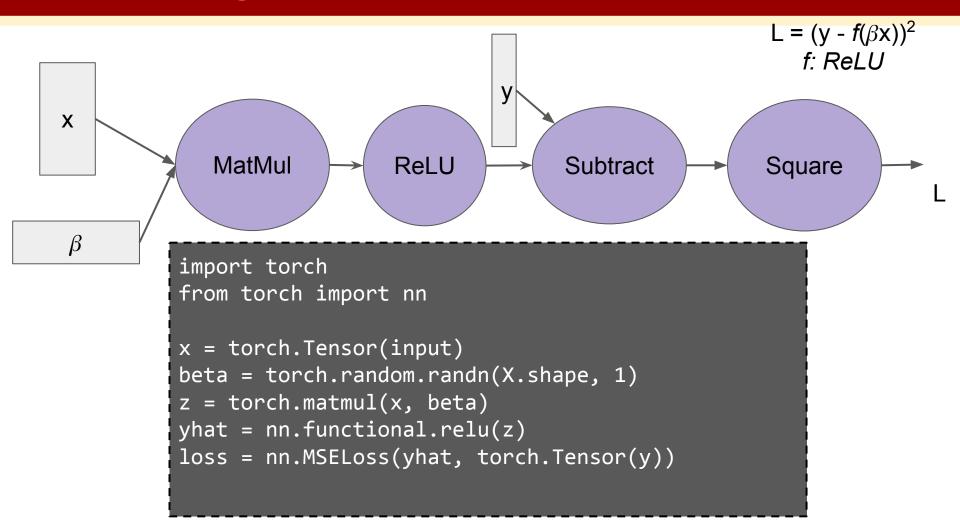

Rectified linear unit (ReLU): ReLU(z) = max(0, z)

Hyperbolic tangent: $tanh(z) = (e^{2z} - 1)/(e^{2z} + 1)$

PyTorch Demo

Native Linear Regression Implementation (Link)

Torch.nn Linear Regression Implementation (Link)

How to train GPT3?

Time to train Bert Large (330 M) on K80, which is 530 times smaller than GPT3

# GPUs	Training Time (minutes)	Per-GPU Scaling Efficiency
1	399	1.00

How to train GPT3?

Time to train Bert Large (330 M) on K80, which is 530 times smaller than GPT3

# GPUs	Training Time (minutes)	Per-GPU Scaling Efficiency
1	399	1.00

For the same amount of data, GPT3 can be trained in 212k mins = 3533 hours = 147 days*

How to train GPT3?

Distributed Training

- Parallelism :
 - Data Parallelism
 - Model Parallelism
 - Hybrid

Distributed PyTorch Training

 Data Parallelism: Scatter dataset into parts across different workers to train on subsets and sync gradients

Data Parallelism

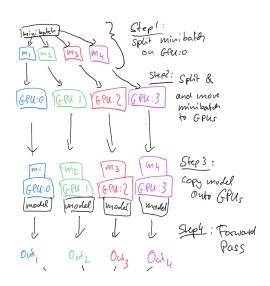

Distributed PyTorch Training

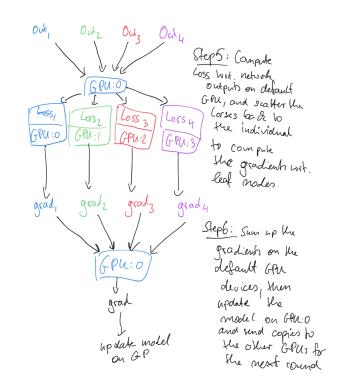

- Data Parallelism: Scatter dataset into parts across different workers to train on subsets and sync gradients
- Modes of Data Parallelism :
 - DataParallel
 - DistributedDataParallel

Data Parallelism

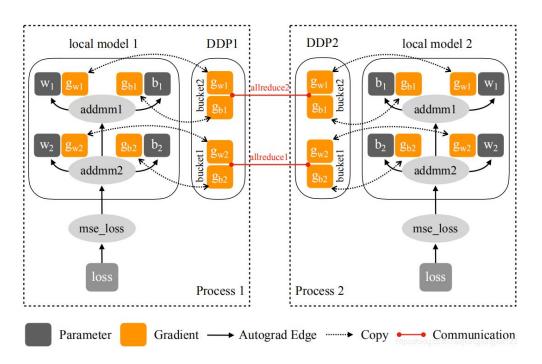

Data Parallel: How it works?

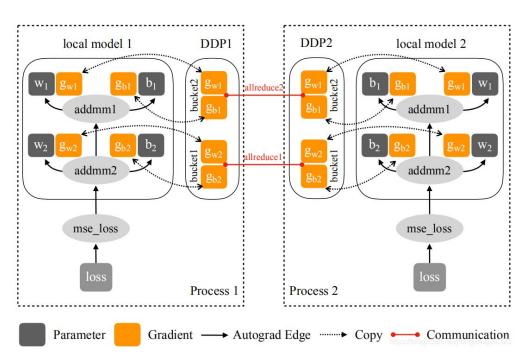

- Data Parallel
 - Most simple form of parallelism with minimal code change
 - Downside: Slower form of parallelism involves inter node communication 3x per training step

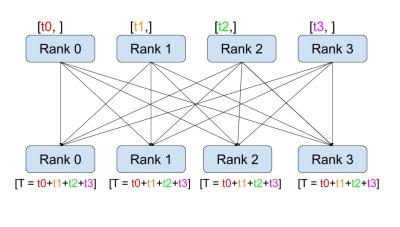

DistributedDataParallel: How it works?

(Li et al., 2020)

DistributedDataParallel

AllReduce

(Li et al., 2020)

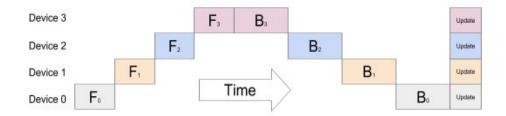

- DistributedDataParallel (<u>Li et al., 2020</u>)
 - Efficient form of parallelism but involves a little extra code change*
 - Performs AllReduce on the computed gradients across all nodes and machines

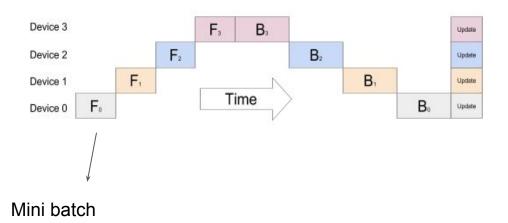

- DistributedDataParallel (<u>Li et al., 2020</u>)
 - Efficient form of parallelism but involves a little extra code change*
 - Performs AllReduce on the computed gradients across all nodes and machines
 - Downside: Python pickles all objects while spawning multiple processes (which happens in DDP). Code might crash if an object is not pickle-able

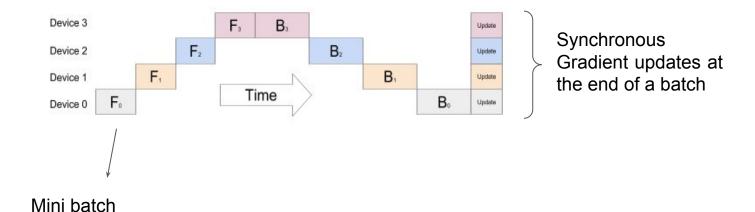

* Extra code change if you are implementing using Pytorch. It has been made extremely simple by

Model Parallelism: Distribute layer(s) of the model into different machines/GPUs to train a very large network.

- Model Parallelism: Distribute layer(s) of the model into different machines/GPUs to train a very large network.
- Model Parallelism
 - Naive Model Parallelism
 - Pipelined Parallelism

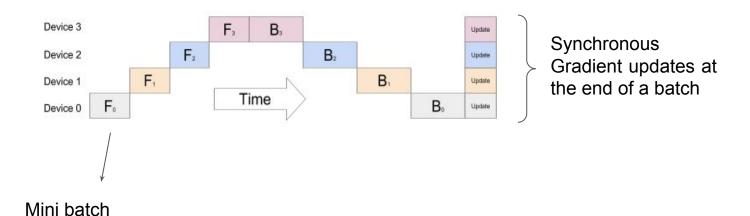

```
class ToyModel(nn.Module): #Pytorch: model parallel tutorial
    def __init__(self):
        super(ToyModel, self).__init__()
        self.net1 = torch.nn.Linear(10, 10).to('cuda:0')
        self.relu = torch.nn.ReLU()
        self.net2 = torch.nn.Linear(10, 5).to('cuda:1')

    def forward(self, x):
        x = self.relu(self.net1(x.to('cuda:0')))
        return self.net2(x.to('cuda:1'))
```

Naive Model Parallelism

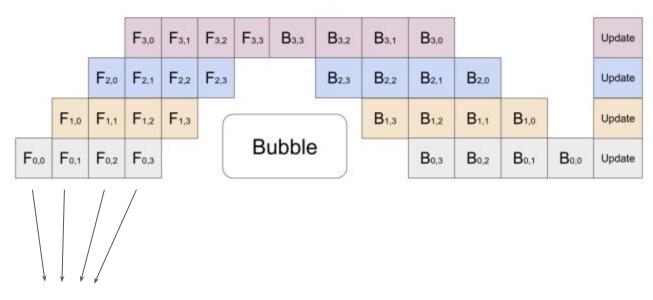

Severe under utilization of resources due to sequential dependency of the network

Pipelined Parallelism

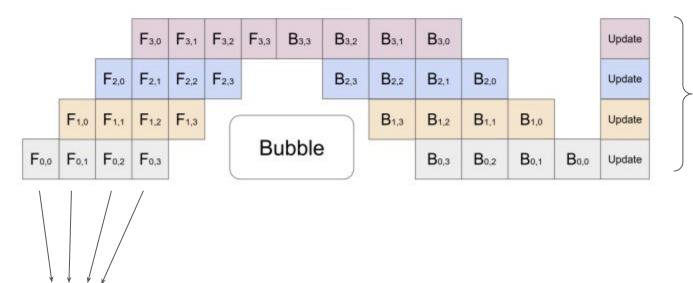

Pipelined Parallelism

Mini batch split into micro batches

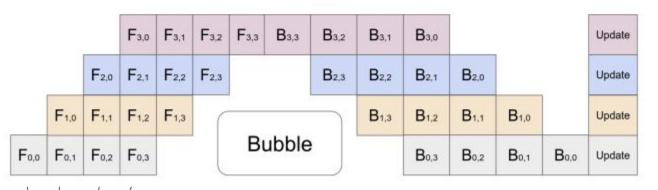

Pipelined Parallelism

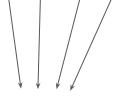

Synchronous
Gradient updates at the end of a batch

Mini batch split into micro batches

Pipelined Parallelism

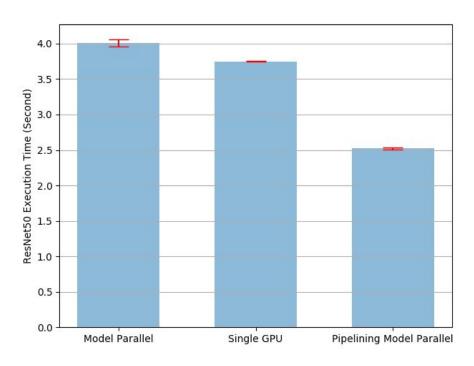

Synchronous
Gradient updates at the end of a batch

Mini batch split into micro batches

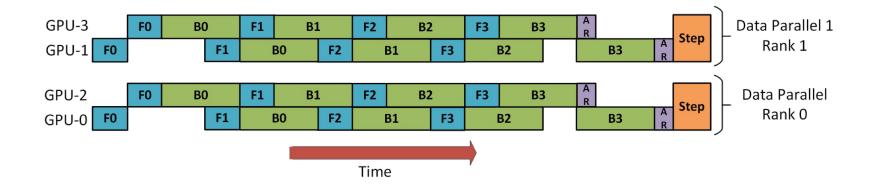

Provides high utilization of workers while ensuring reliable + stable training

Pipelined Parallelism

PyTorch: Model Parallel best practices

- Hybrid
 - DeepSpeed (<u>Rasley et al., 2020</u>)

Horovod: PyTorch > PySpark

Horovod is a distributed deep learning training framework.

Horovod helps scaling single GPU (worker) into multi-GPU or even multi-host training without no code change

Horovod on spark: "provides a convenient wrapper around Horovod that makes running distributed training jobs in Spark clusters easy"
